**Introduction**

TGE is a new dedicated designed series of thermostatic expansion valves with lots of technical innovations for all normal refrigerants including R410A, and use in applications such as:

- Air conditioning systems,
- Heat pumps,
- Water chillers,
- Refrigerated containers,
- Traditional refrigeration systems.

The hermetic tight design meets the environmental demands for today and future. The capacity from 4 to 50 TR (14 kW to 175 kW) (R410A).

This leaflet contains data and code numbers for TGE valves for refrigerants R410A, R22, R407C, R134a, R404A, R507. Versions for other refrigerants can be produced to order, contact Danfoss for further information.

**Features**

- Hermetic TXV for R22, R134a, R404A, R507, R407C, R410A
- Head pressure independent
- Version with MOP (Max. Operating Pressure)
- Straightway flow
- Balance port (BP)
- Low hysteresis
- Opening superheat (OSH) max. 4°C
- Max. working pressure 46 bar/ 667 psi
- Lifetime for heat pump application
- Cylindrical bulb design with new bulb strap
- Biflow with expansion in both directions
- Adjustable superheat setting
- Laser welded, stainless steel power element / capillary tube
- Mechanical connections (solder/flare, M10, ORFS) available

**Standard programme**

Thermostatic charge for R410A, R22, R134a, and R407C:

N -40 → +10°C without MOP

-40 → +50°F without MOP

K -25 → +10°C MOP + 15°C

-15 → +50°F MOP + 60°F

Static superheat (SS): 4K / 7.2°F

**Connection**

Type	Inlet ODF solder	Outlet ODF solder
TGE10	$\frac{3}{8}, \frac{1}{2}, \frac{5}{8}$	$\frac{5}{8}, \frac{7}{8}, 1\frac{1}{8}$
	10, 12, 16	16, 22, 28
TGE20/40	$\frac{5}{8}, \frac{7}{8}, 1\frac{1}{8}$	$\frac{5}{8}, \frac{7}{8}, 1\frac{1}{8}, 1\frac{3}{8}$
	16, 22, 28	16, 22, 28, 35

**Capillary tube length**

Type	Capillary tube length
TGE10	1.5 m      5 ft
TGE20	1.5 m or 3 m      5 ft or 10 ft
TGE40	1.5 m or 3 m      5 ft or 10 ft

**Valve options**

In addition to the standard programme, variants of following options may be available:

- Refrigerants
- Evaporator range
- MOP point
- Static superheat setting (0K / 0°F → 8K / 14.4°F)
- Flare connections

Please contact your nearest Danfoss sales office to discuss valve options.

## Technical data

**Max. operating temperature**

- Thermostatic element

N charge: 100°C / 210°F (R410A)

K charge: 150°C / 302°F (R410A)

Valve body: 110°C / 230°F

*Max. working pressure* 46 / 667 psig

*Max. test pressure* 51 bar / 740 psig

TGE valves are designed for biflow operations.

**MOP function**

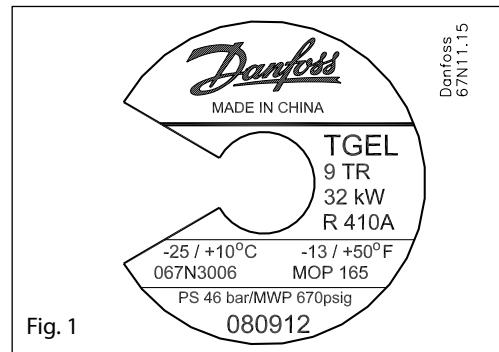

Refrigerant	Range K -25 → +10°C / -15 → +50°F
	MOP point for evaporating temperature $t_e$ and evaporating pressure $p_e$ $t_e = +15^\circ\text{C}/+60^\circ\text{F}$
R22	100 psig / 8 bar
R407C	95 psig / 7.5 bar
R134a	55 psig / 5 bar
R410A	167 psig / 12.5 bar
R404A/ R507	120 psig / 8.4 bar

**Identification**

Important valve information is provided on the diaphragm element (fig. 1)

*Main valve example:*

TGE	= Valve type
9 TR	= Rated capacity $Q_{nom}$ in tons of refrigeration
32 kW	= Rated capacity $Q_{nom}$ in kW
R410A	= Refrigerant
-25 / +10°C	= Evaporating temperature range (°C)
-13 / +50°F	= Evaporating temperature range (°F)
067N3006	= Code number
MOP K	= Max. Operating Pressure in K
PS 46 bar / MWP 670 psig	= Max. Working Pressure in bar and psig
080912	= Date code (Sep 12, 2008)

*Refrigerant code:* R22 = X  
R410A = L  
R407C = Z  
R134a = N  
R404A/  
R507 = S

**Rated capacity\***

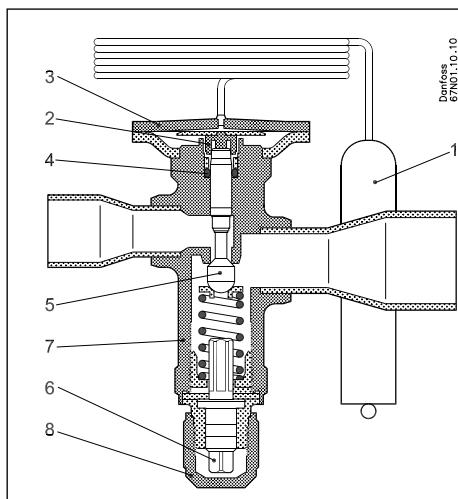

Typ	R22		R134a		R404A/R507		R407C		R410A

\*) Rated capacity according to ASERCOM standard

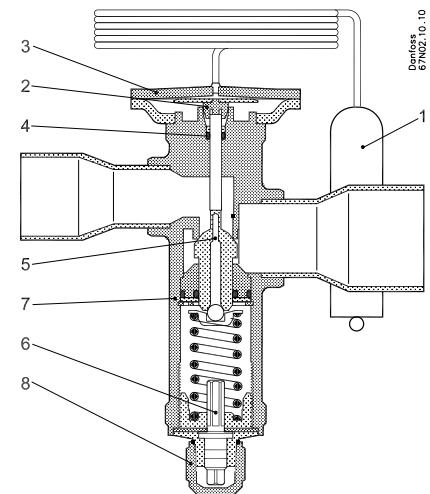

Evaporating temperature,  $T_e = 4^\circ\text{C}$ , Liquid temperature,  $T_l = 37^\circ\text{C}$   
Condensing temperature,  $T_c = 38^\circ\text{C}$ , Opening superheat, OS=4K

**Design and function**

1. Bulb with capillary tube
2. Thrust pad
3. Thermostatic element
4. Push pin seal
5. Two-way balance port
6. Static superheat adjustment spindle
7. Valve body
8. Protective cap

*Fig. 5  
Balanced port design  
Adjustable setting*

*Fig. 6  
Balanced port design  
Biflow and adjustable setting*

The central push pin is fitted with a robust seal (4) that ensures maximum tightness for the life of the valve.

Static superheat (SS) can be adjusted by the setting spindle (6), see fig. 5. The standard superheat setting (SS) is 4K / 7.2°F and adjustable for 0 → 8K / 0 → 14.4°F.

SS = static superheat  
OS = opening superheat  
SH = SS+OS= total superheat

*Example:*

Static superheat SS = 4K / 7.2°F (factory setting)

Opening superheat OS = 4K / 7.2°F

The opening superheat is 4K, i.e. from the point the valve begins to open up to nominal capacity. Opening superheat is determined by the design and cannot be changed.

Total superheat SH = SS+OS

$$SH = 4+4 = 8K / 14.4°F$$

Total superheat SH can be altered by changing SS (by using the setting spindle).

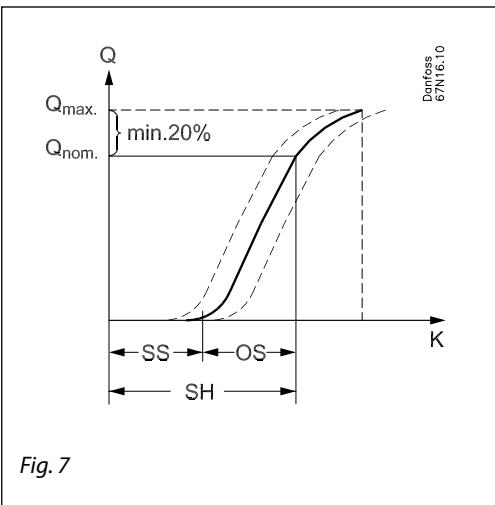

**Balanced port design and advantage**

The TGE series of thermostatic expansion valves have balanced port design.

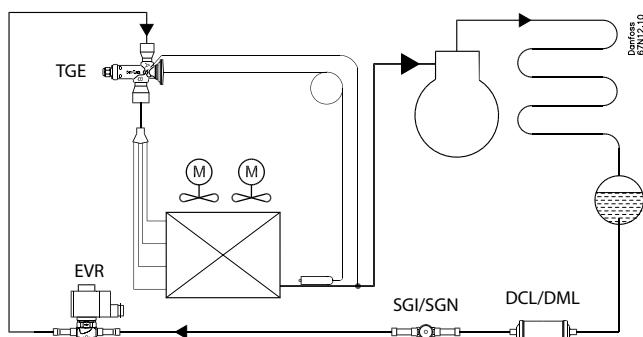

Balanced port design prevents changes in pressure drop across the valve from influencing operation and provides excellent control on applications having widely varying operating conditions.

Balanced port TXV's are recommended in refrigeration and air conditioning systems with any combinations of these conditions:

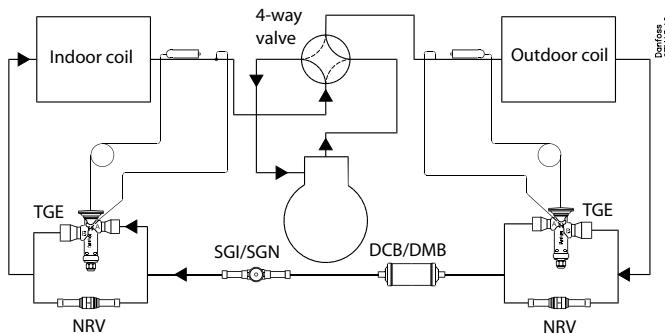

- 1) Widely varying head pressures
- 2) Widely varying evaporator loads
- 3) Widely varying pressure drop across the TXV
- 4) Fluctuating or extremely low liquid temperatures
- 5) Intermittent liquid line flash gas

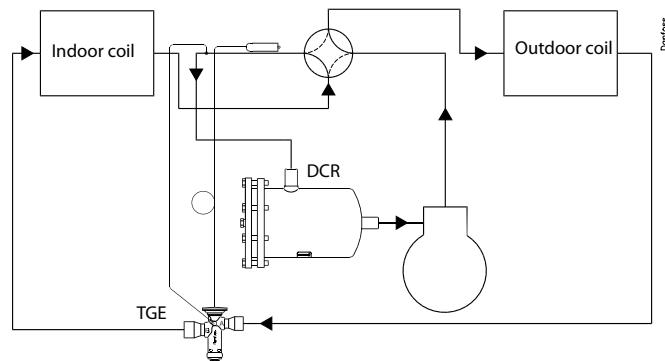

*Fig. 7*

**Application**

*Fig. 2  
Traditional refrigeration plant*

*Fig. 3  
Conventional system with summer/winter operation*

*Fig. 4  
Simplified heat pump system*

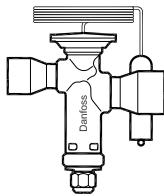

Fig. 2 is a diagram of a traditional refrigeration plant where TGE is used for flow in one direction only.

Fig. 3 is a conventional split heat pump system shown in cooling mode. This system has two TGE thermostatic expansion valves with fixed direction flow. An NRV check valve is placed in series with each TGE to allow liquid refrigerant to bypass when flow is opposite the TXV fixed direction.

**Ordering**

The valve and bulb straps are supplied in industrial packs or multi packs:  
 Industrial pack, TGE10 / 12 pcs  
 Industrial pack, TGE20 / 8 pcs  
 Industrial pack, TGE40 / 8 pcs

Multi pack, TGE10 / 12 pcs  
 Multi pack, TGE20 / 8 pcs  
 Multi pack, TGE40 / 6 pcs

**Ordering

**Correction for subcooling  $\Delta t_{sub}$**   
The evaporator capacity used must be corrected if the subcooling deviates from 4 K. The corrected capacity can be obtained by dividing the required evaporator capacity by the correction factor given across, and then selecting from the tables.

Note: Flash gas can form if subcooling is too low.

Correction factor	$\Delta t_{sub}$	4 K	10 K	15 K	20 K	25 K	30 K	35 K	40 K	45 K	50 K

**Correction for subcooling  $\Delta t_{sub}$** 

The evaporator capacity used must be corrected if the subcooling deviates from 4 K. The corrected capacity can be obtained by dividing the required evaporator capacity by the correction factor given across, and then selecting from the tables.

Note: Flash gas can form if subcooling is too low.

Correction factor	$\Delta t_{sub}$	4 K	10 K	15 K	20 K	25 K	30 K	35 K	40 K	45 K	50 K

**Correction for subcooling  $\Delta t_{sub}$** 

The evaporator capacity used must be corrected if the subcooling deviates from 4 K. The corrected capacity can be obtained by dividing the required evaporator capacity by the correction factor given across, and then selecting from the tables.

Note: Flash gas can form if subcooling is too low.

Correction factor	$\Delta t_{sub}$	4 K	10 K	15 K	20 K	25 K	30 K	35 K	40 K	45 K	50 K

**Correction for subcooling  $\Delta t_{sub}$** 

The evaporator capacity used must be corrected if the subcooling deviates from 7.2°F.

The corrected capacity can be obtained by dividing the required evaporator capacity by the correction factor given across, and then selecting from the tables.

Note: Flash gas can form if subcooling is too low.

$\Delta t_{sub}$	10 °F	20 °F	30 °F	40 °F	50 °F	60 °F	70 °F	80 °F	90 °F	100 °F
Correction factor	1.00	1.08	1.13	1.18	1.23	1.29	1.34	1.39	1.44	1.49

## Capacity (continued)

**R404A/ R507**

Capacity in Tons for range N and K, opening superheat OS: 7.2°F

Type	Rated capacity [tons]	Pressure drop across the valve $\Delta p$ psig							Pressure drop across the valve $\Delta p$ psig

*Correction for subcooling  $\Delta t_{sub}$* 

The evaporator capacity used must be corrected if the subcooling deviates from 7.2°F.

The corrected capacity can be obtained by dividing the required evaporator capacity by the correction factor given across, and then selecting from the tables.

Note: Flash gas can form if subcooling is too low.

$\Delta t_{sub}$	10 °F	20 °F	30 °F	40 °F	50 °F	60 °F	70 °F	80 °F	90 °F	100 °F
Correction factor	1.00	1.08	1.14	1.20	1.26	1.31	1.37	1.43	1.48	1.54

</tbl\_r

**Sizing****Sizing examples (SI and US)**

Refrigerant R410A

Evaporator capacity  $Q_e = 25 \text{ kW} / 7 \text{ TR}$ Evaporator with several circuits, i.e.  
a valve with distributor is requiredEvaporating temperature  $t_e = 0^\circ\text{C} / 32^\circ\text{F}$  $p_e = 8 \text{ bar} / 116 \text{ psi}$ Condensing temperature  $t_c = +36^\circ\text{C} / 96.8^\circ\text{F}$  $p_c = 22 \text{ bar} / 319 \text{ psi}$ Refrigerant liquid temperature  $t_l = +26^\circ\text{C} / 78.8^\circ\text{F}$ Subcooling  $\Delta t_{\text{sub}} = 36 - 26 = 10 \text{ K} / 96.8^\circ\text{F} - 78.8^\circ\text{F} = 18^\circ\text{F}$ *From the data supplied determine pressure drop  $\Delta p$  across TGE.*Pressure drop  $\Delta p_1$  in liquid lines, pipe bends,  
filter, sight glass, solenoid valve, etc. can be  
assumed to be 0.5 bar / 7.25 psiPressure drop  $\Delta p_2$  in the liquid distributor can  
also be assumed as 0.5 bar / 7.25 psi.From the diagram it can be seen that evaporating  
pressure  $p_e$  is equal to  $p_c - \Delta p - \Delta p_1 - \Delta p_2$ .Thus, pressure drop  $\Delta p$  across TGE equals  
 $p_c - p_e - \Delta p_1 - \Delta p_2 = 22 - 8 - 0.5 - 0.5 = 13 \text{ bar} / 188.5 \text{ psi}$ Pressure drop in risers, etc. is not taken into  
account.The correction factor at  $\Delta t_{\text{sub}} = 10 \text{ K} / 18^\circ\text{F}$  is 1.08.  
The corrected evaporator capacity thus  
becomes 25 kW / 7TR divided by 1.08 = 23.1 kW /  
6.5 TR.Since the capacity of the expansion valve must  
be equal to or slightly higher than the corrected  
evaporator capacity of 23.1 kW / 6.5 TR, a TGEL 6.5  
giving 23.5 kW / 6.5 TR at  $\Delta p = 12 \text{ bar} / 190 \text{ psi}$   
would be a suitable choice (See tables below).**R410A****Capacity in kW**
