PEST CONTROL SERVICES

TERMITE

Termites are often called the “silent destroyer” because they may be secretly hiding and thriving in your home or yard without any immediate signs of damage. By the time they are detected, they may have already caused substantial damage to your property resulting in aggravation and financial loss.

- Baiting system
- Corrective treatment

MOSQUITOES

Mosquitoes, the insects that are universally hated the world over. These pesky, disease-carrying pests make a living by sucking the blood out of just about anything that moves, including us. According to WHO, mosquito bites results in the death of more than 1 million people every year.

- Fogging
- Larviciding

COCKROACHES

Cockroaches are winged insects found in nearly every part of the world. Although they are one of the most primitive living insects, they are very adaptable. Some of the species have invaded human habitats and are considered pests since they can spread disease.

- Residual spray
- Gel baiting
- Monitoring trap

EXPERT PEST CONTROL FOR YEAR-ROUND PROTECTION !!

FLIES

Several species of flies may become pests around the home. The housefly is the most common pest, but the little flies are also troublesome. However, they can carry diseases such as dysentery & food poisoning and typhoid fever. Therefore, home fly control is important to good sanitation and family health.

- Flies catcher
- ULV misting

RAT

Rats can be carriers of diseases. They can transmit these diseases through physical contact, bites, by contamination or by fleas that are feeding on the rodent.

- Baiting
- Rat station
- Glue board

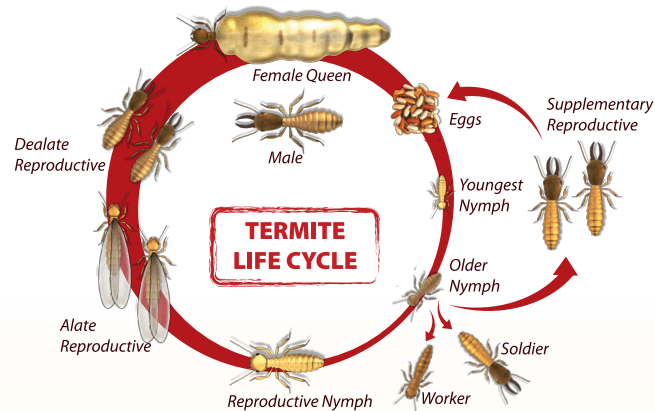

ANT

Ants are a social insect that live in colonies. Treatment plans should include killing the entire colony. Just spraying an ant with a typical ant spray, particularly a repellent spray will only kill a few at best.

- Residual spray
- Gel baiting

TERMITES PROBLEM SOLUTION

SYSTEM A In Ground (IG) Bait Station

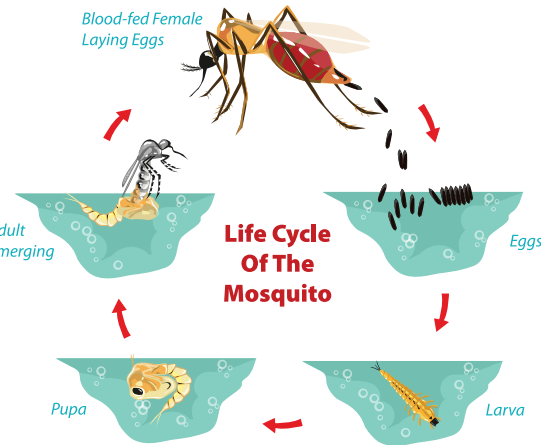

Once termites are discovered feeding in the station, the monitoring device will add with termite bait. It takes advantages of the natural behaviour of termites to spread the bait throughout the colony. The bait ingested by termites stops their molting process. In time, all termites in the colony are eliminated.

SYSTEM B Above Ground (AG) Bait Station

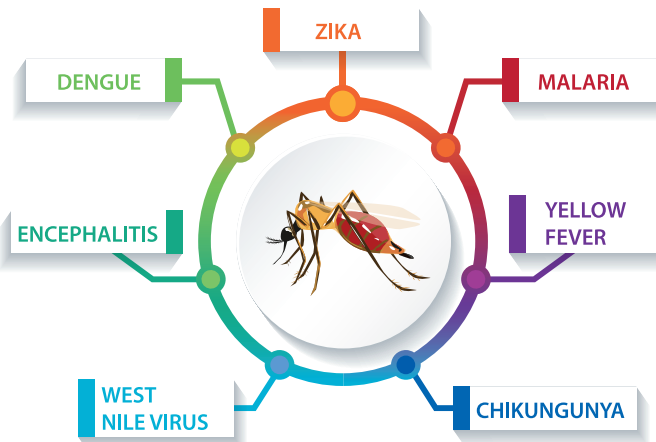

Technician will inspect it on a fortnightly basis for one month and follow by monthly inspection until elimination of colony. Which is normally takes 2-3 months. If active feeding continues when half of the bait has been consumed, additional bait would be added on top of existing station.

MOSQUITO PROBLEM

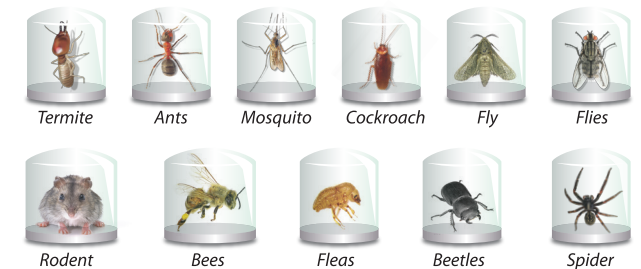

MOSQUITO Root Cause Bring Death

GENERAL PEST CONTROL

There are many types of pest in Malaysia. They can range from termites, which are extremely destructive, to rodents, cockroaches and mosquitoes, notorious for carrying all types of disease to bed bugs and more. Each type of pest is unique in its feeding and breeding habits. The methods used to exterminate them can vary significantly too, as can the DIY solutions available in the market today. Indeed there are various types of pesticides, repellents, sprays and traps available in DIY stores but sometimes, they can do more harm than good. Why? because if the wrong method is used or pest not exterminated completely, the infestation can potentially resurface, wreaking more havoc and destruction the second time around.
