Nowadays many of us are having issues with poor memory and lack of awareness on having/creating same passwords to all application and systems. Some of us write their credentials details on a piece of paper, notepad, or sticky notes in pc, and some of us store their credentials details in browser password setting. Based on your opinion, is it safe to store your password in browsers like Chrome, Edge. Are there any alternative ways to have a different difficulty password in every application? If yes, what is your best suggestion to memorize all those difficult passwords?

**OBJECTIVE:**

Students will learn and understand the concept of password manager.

**TIME ALOCATED:**

20 mins - discussion in the breakout room

10 mins - presentation by the group leader
