DUNGS[®]
Combustion Controls

ATEX

The abbreviation **ATEX** stands for the French term "Atmosphère explosible" and is used as synonym for the two EU directives concerning explosion protection:

Directive 2014/34/EU

Workplace directive 1999/92/EC

ATEX product range

The equipment of the DUNGS ATEX product range complies with equipment group II, category 3 for gas and dust. It may only be used in zones 2 and 22.

Approvals/declaration of conformity

DUNGS issues a manufacturer's declaration of conformity for all equipment of the ATEX product range.

EU type testing certificate as per:

- EU-Gas Appliances Regulation
- EU-Pressure Equipment Directive

DUNGS ATEX product range

ATEX Directive 2014/34/EU

Directive 2014/34/EU concerning equipment and protective systems intended for use in potentially explosive atmospheres. It determines rules for placing products, which are intended for use in potentially explosive atmospheres, on the market. For the first time, non-electrical equipment is covered by this directive. Turning couplings, for example, can create a risk of ignition due to inadmissibly high warming.

Annex II of this directive contains the general requirements concerning health and safety protection to be observed by the manufacturer and to be proven by means of the corresponding conformity assessment procedures.

ATEX Workplace directive 1999/92/EC

Determination of minimum requirements for improving the safety and health protection of workers potentially at risk from explosive atmospheres. This directive contains basic safety requirements that must be implemented by the operator/employer. These include:

- **Primary explosion protection**
Prevention or limitation of the formation of explosive atmospheres
- **Secondary or constructive explosion protection**
Avoidance of effective ignition sources
- **Tertiary explosion protection**
Mitigation of the detrimental effects of an explosion to a harmless degree

The purpose of this directive is the protection of persons working in potentially explosive atmospheres.

Explosion protection document

The employer/operator shall create an **explosion protection document** within his **risk assessment** and divide areas with hazardous, potentially explosive atmosphere into **zones**. He shall create an **Ex zone plan** representing the extension of each individual zone and, if necessary, the overall dimensions.

The explosion protection document shall demonstrate in particular:

- that the explosion risks have been determined and assessed
- a list of measures taken in order to prevent explosions
- the division of areas with potentially explosive atmospheres into zones (Ex zone plane)
- compliance with minimum requirements

The form of the explosion protection document is not prescribed. All relevant documentation that might be useful for evaluating an explosion hazard may be added to the explosion protection document:

Registers of hazardous substances, user manuals of the used equipment according to ATEX Equipment directive 2014/34/EU, operating instructions, organisational measures, risk assessments, alarm and risk prevention plan.

The operator is solely responsible for the safety of his installation:

- Creation of the installation-specific explosion protection document
- Determination of the zones
- Use of equipment conform to a certain zone
- Proper installation
- Examination prior to putting into service
- Regular check and maintenance of the installation in order to maintain the proper condition of the overall installation.

| Definition of ATEX terms | | | | | |
|-----------------------------|--|--------------------|---|--|--|
| Equipment | 'Equipment' means machines, apparatus, fixed or mobile devices, control components and instrumentation thereof and detection or prevention systems which, separately or jointly, are intended for the generation, transfer, storage, measurement, control and conversion of energy for the processing of material and which are capable of causing an explosion through their own potential sources of ignition. | | | | |
| Components | 'Components' means any item essential to the safe functioning of equipment and protective systems but with no autonomous function. | | | | |
| Equipment groups | Equipment group I | | | Equipment group II | |
| | Equipment intended for use in mines, surface and underground parts | | | Equipment intended for use in other places | |
| Categories | Category 1 | | Category 2 | | Category 3 |
| | Very high level of protection | | High level of protection | | Requisite level of protection during normal operation |
| Explosive atmosphere | Gases, vapours, mists | | | Dusts | |
| | G | | | D | |
| Explosion groups | Gases and vapours are classified in three explosion groups due to their special flammability. Their hazardous nature increases from explosion group IIA to IIC. The higher explosion group, e.g. IIC, includes the lower groups IIB and IIA. | | | | |
| | IIA | | IIB | | IIC |
| Temperature classes | The admissible surface temperatures are divided into 6 temperature classes (T1-T6). Combustible gases and vapours can be classified in these temperature classes based on their ignition points. The following max. allowable surface temperatures of the equipment are valid for the temperature classes. A higher temperature class, e.g. T6, includes any lower temperature classes, e.g. T5 ...T1. | | | | |
| | T1 ≤ 450 °C | T2 ≤ 300 °C | T3 ≤ 200 °C | T4 ≤ 135 °C | T5 ≤ 100 °C T6 ≤ 85 °C |
| Division into zones | The operator/employer shall classify all areas of his company, independently of the size of the company, into zones with explosion hazard and document them in the explosion protection document. The zones are defined based on the probability of the formation of explosive atmospheres. | | | | |
| Gases Vapours Mists | Zone 0 | | Zone 1 | | Zone 2 |
| | Zone 0 is a place in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is present continuously or for long periods or frequently. | | Zone 1 is a place in which an explosive atmosphere consisting of a mixture with air or flammable substances in the form of gas, vapour or mist is likely to occur in normal operation occasionally. | | Zone 2 is a place in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is not likely to occur in normal operation but, if it does occur, will persist for a short period only. |
| Dusts | Zone 20 | | Zone 21 | | Zone 22 |
| | Zone 20 is a place in which an explosive atmosphere in the form of a cloud of combustible dust in air is present continuously, or for long periods or frequently. | | Zone 21 is a place an explosive atmosphere in the form of a cloud of combustible dust in air is likely to occur in normal operation occasionally. | | Zone 22 is a place an explosive atmosphere in the form of a cloud of combustible dust in air is not likely to occur in normal operation but, if it does occur, will persist for a short period only. |

MV ... X
MVD ... X

Technology

Solenoid valves for ATEX requirements II3GD.

Automatic shut-off valve acc. to EN 161 for gas burners and gas burning installations:

- Max. operating pressure up to 200 or 500 mbar
- without current closed
- fast opening
- main flow adjustable
- DC solenoid, rectifier wiring in connector box with **connecting cable 5 m**
- Pipe thread as per ISO 7/1
- Flange connection acc. to DIN 26 33, ISO 7005
- reliably operating, robust and maintenance-free

Media/use

MV ...X
MVD ... X

Suitable for gases of gas families 1, 2 and 3 and other neutral gases as well as air, smoke and exhaust gases. Version without non-ferrous material (S02) suitable for gases up to max. 0.1 vol. % H₂S, dry.

Approvals

ATEX
Manufacturer's declaration according to ATEX Directive 2014/34/EU: II3GD

EU type testing certificate as per EU-Gas Appliances Regulation: CE-0123 CT 1056

EU type testing certificate as per EU-Pressure Equipment Directive: CE0036

Function

The safety solenoid valve by DUNGS is an automatic shut-off valve activated by auxiliary power. The electromagnetic drive opens against the closing spring. The armature stroke can be limited by means of an adjustment screw (D function). If the auxiliary power (operating voltage) is interrupted, the closing spring closes the valve within 1 s.

MV ... X: solenoid valve, one stage operation, closed without current, fast opening, fast closing.

MVD ... X: solenoid valve, one stage operation, closed without current, fast opening, fast closing. The gas flow can be limited manually by means of the main flow setting.

Attention!

Read the operating and mounting instructions before putting the device into service.

High-pressure switch for gas, air, flue and exhaust gases

Gas: II3G Ex nC IIB T6 Gc
 Dust: II3D Ex tc IIIB T75°C Dc
 Environment: -15 °C ≤ Ta ≤ +70 °C

GW...A4/2 HP X

Function Overpressure switch

GW...A4 HP/2 X Pressure switch in overpressure range

The pressure acts on the micro switch via the metal bellows against the force of the adjusting spring. The pressure switch works without auxiliary power.

Only GW...A4 HP/2 X

All gas-bearing parts are made of stainless steel 1.4541 and are suitable for:

- Biogas applications
- Aggressive media such as sulfuric acid with concentrations up to 1.0 vol. %

Differential pressure switch for gas, air, flue and exhaust gases

Gas: II3G Ex nC IIB T6 Gc
 Dust: II3D Ex tc IIIB T75°C Dc
 Environment: -15 °C ≤ Ta ≤ +70 °C

GGW...A4/2 X
 GGW...A4-U/2 X

Differential pressure switch function

GGW...A4/2 X and GGW...A4-U/2 X Differential pressure switch in overpressure and negative pressure range.

The differential pressure acts on the micro switch via the membrane against the force of the adjusting spring. The pressure switch works without auxiliary power.

Device selection

GGW...A4/2 X and GGW...A4-U/2 X

If the lower pressure p_2 (upper chamber) is a positive pressure compared to the atmosphere, type GGW...A4/2 X must be used.

If the lower pressure p_2 (upper chamber) is a negative pressure compared to the atmosphere, type GGW...A4-U/2 X must be used.

Overpressure switch

GGW...A4/2 X

Pressure connection G ¼

The control unit reacts on overpressure, which connects, disconnects or switches a circuit when exceeding or falling below a set nominal value. Simply acting pressure switch in overpressure range. The G ¼ pressure connection must not be closed.

Minimum pressure switch

GGW...A4-U/2 X

Pressure connection G ⅜

The control unit reacts on negative pressure, which connects, disconnects or switches a circuit when exceeding or falling below a set nominal value. Simply acting pressure switch in negative pressure range. The G ¼ pressure connection must not be closed.

Technology

Adjustable pressure switches for ATEX requirements II3G and II3D.

The pressure switches are suitable for activating, deactivating or switching a circuit if the actual value of the pressure changes compared to the set nominal value.

The nominal value (switching point) is set by means of a setting wheel with scale.

Media/use

GW...A4 HP/2 X

GGW...A4/2 X

GGW...A4-U/2 X

Suitable for gases of gas families 1, 2 and 3 and other neutral gases as well as air, flue and exhaust gases.

Version without non-ferrous material, suitable for gases up to max. 0.1 vol. % H₂S, dry.

Approvals

ATEX

Manufacturer's declaration according to ATEX Directive 2014/34/EU:

II3G and II3D

EU type testing certificate as per EU-Gas Appliances Regulation:

CE-0123 CT 1089

EU type testing certificate as per EU-Pressure Equipment Directive:

CE0036

Attention!

Read the operating and mounting instructions before putting the device into service.

Switching function

With increasing pressure:

1 NC opens, 2 NO closes.

With decreasing pressure:

1 NC closes, 2 NO opens.
