

VAV Variable Air Volume Box

Introduction

Used mainly in Green Buildings, the VAV Box maintains proper minimum airflow set points to ensure proper ventilation in a occupied space.

Unlike many VAV terminals which required the most ideal flow conditions in order to operate at their optimum, Prudentaire's VAV units are able to perform even at least ideal conditions (minimum 1D bend & 2D branch). Unlike many flow sensors, the unit's airflow sensor grid comes with 5 individual traverse lines connecting to a central averaging chamber to give a more accurate reading. This center averaging, which lacks in many VAV terminal units, is the single most important feature required for accurate airflow measurement.

To further add on to the accuracy of the measurement, the sensor locations followed closely to the ASHRAE recommendations on log-Tchebycheff rule (ISO 3966).

CONSTRUCTIONS & MATERIALS

Features

- Capacities ranging from 94 – 6925 CMH in 7 standard sizes
- Customizable sizes available
- Available with pneumatic or direct digital controls
- Pressure independent operation
- Can be used for VAV or constant volume applications
- Factory calibrated to job requirements
- Full range of accessories available (i.e. heating coils, attenuators, access, doors, etc.)

Base Unit Constructional Materials

- Damper casing : 0.6/0.7 mm thk GI metal according to VAV box size
- Modulating blade : Double layer 0.8mm GI Metal
- Acoustic cladding : 25mm thk, 32kg/m³ density fiber glass with matt black facing protection
- Shaft : 12.0mm thk GI round shaft
- Leakage seals : Anti-leakage rubber seals
- VAV actuator controller : Belimo (other brands available)

- Calibration Curves Verified By Datuk Ir. Prof. Dr Ow Chee Sheng
- Calibration Curves Verified By Ir. Yim Hon Wa
- Wind Tunnel In Accordance to AMCA-210 Standard
- Customizable Inlet and Outlet Spigots Sizes.

FUNCTION DESCRIPTION

Room Temperature Control

In VAV systems, room temperature is the primary controlled variable. Output signal from the room temperature controller is fed to the control circuit which in turn alters the required set point flow rate value of the supply air flow rate. Maintaining / changing room temperature takes the form of controlling the minimum and maximum flow rate limits of supply air to the occupied zone.

Upstream Flow Rate Measurement

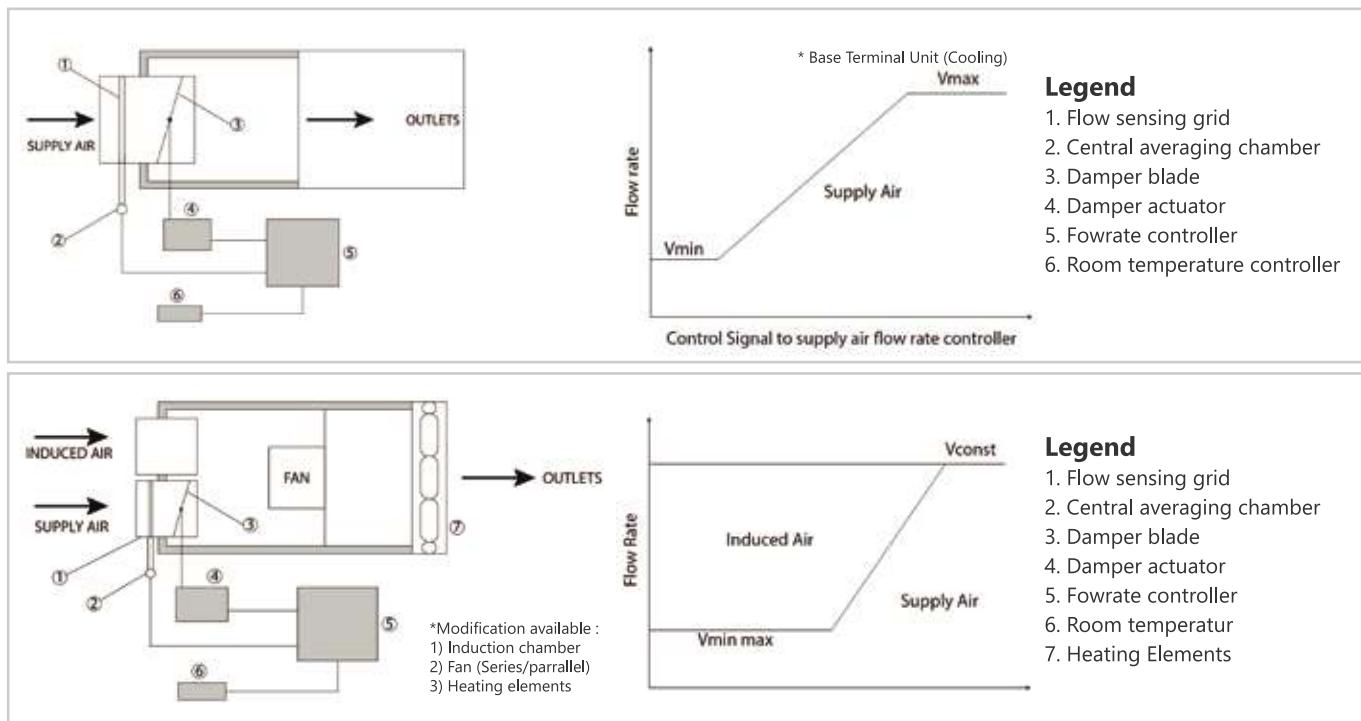

The airflow sensor grid comes with 10 individual traverse lines (Front & back) connecting to a central averaging chamber to give a more accurate reading. Each traverse line consist of 3 pressure sensing ports (totaling 30 pressure sensing ports for each unit) located at strategic locations (in accordance to Log-Tchebycheff rule) to factor in the usual non-uniform airflow profile. With these key features, the sensor delivers the accurate pressure differential readings (velocity pressure) for supply airflow control purposes.

Air Flow Volume Control

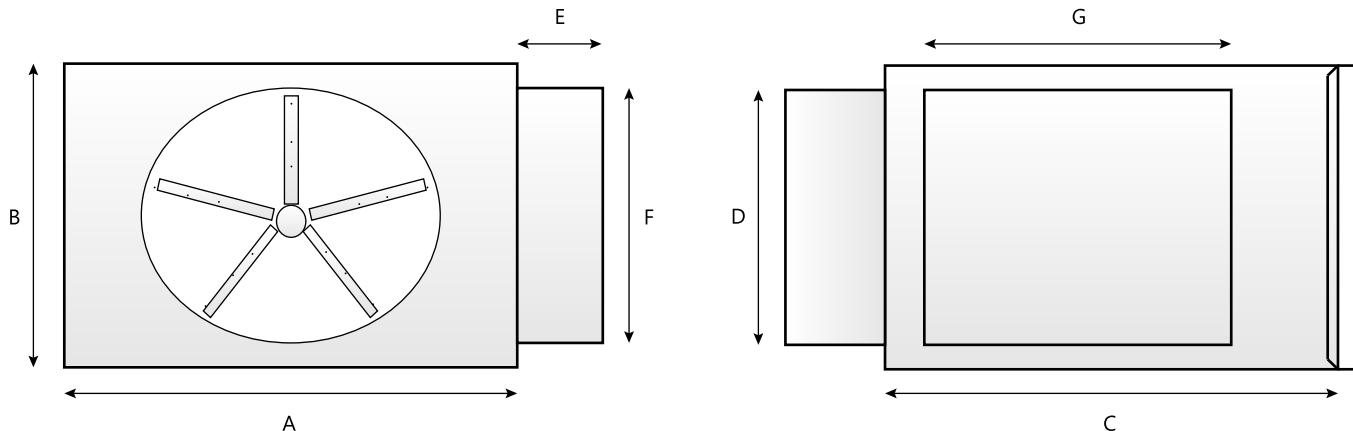

Supply airflow volume varies with the changing system pressure, which pose a problem to pressure dependent VAV terminal units. Therefore in order to remove the dependence on system pressure, required control process is needed to maintain the much needed supply airflow volume, i.e. Measure – compare – maintain.

Pressure differential measurement taken is converted into an electrical signal, which is interpreted as the actual airflow value flowing through the unit. The controller compares the actual value with the set point value and alters the positioning of the damper blade with the reference to the value difference.

RECOMMENDED INSTALLATION METHOD

Installation Instructions:

1. The VAV terminals shall be installed at least two support brackets (One for the base unit, the other for accessories if any). Each of these brackets shall be fixed with two threaded rods to the ceiling slabs above.
2. Recommended entry flow conditions as followed :
 - i. Min 5D from main duct
 - ii. Min 1D radius from secondary duct
3. Additional volume control dampers before the inlet are required / recommended.
4. All connections shall be thermally isolated
5. Pressure sensing tubes of the flow sensor shall not be 'kinked' or otherwise obstructed by the external duct insulation.

PRODUCT SELECTION CHECKLIST

1. Select unit inlet size based on control and acoustic parameters
2. Select control type :
 - i) Standalone
 - ii) BACNet
 - iii) LONWorks
3. Select reheat coil, fan (if required)
4. Select control sequence based on system design

TECHNICAL SPECIFICATION

General

- a. Variable Air Volume (VAV) terminal units shall be factory assembled, consisting of a sound reducing air chamber, round inlet spigot, tight seal damper blade, and rectangular outlet for duct connection. VAV boxes shall be provided for areas as indicated on the drawings and equipment schedule.
- b. VAV boxes shall be rectangular or circular type, DDC (Direct Digital Control) controlled pressure independent designed for accurate measurement and control of volume airflow.
- c. VAV boxes shall be supplied complete with controllers, actuators and sensors by the VAV manufacturer to ensure single source responsibility for the unit performance. VAV terminal units shall be LON, BACnet or standalone compatible.
- d. The VAV unit shall be product of a single manufacturer certified to ISO9001 for the manufacturer of such equipment. The controller and actuator, if not originally manufacturer by the VAV manufacturer shall be product of a single manufacturer certified to ISO9001 for the manufacturer of control equipment to ensure compatibility.
- e. VAV units and wind tunnel performance data submitted shall be tested in accordance to ISO130-20098, ISO120-1999 or equivalent. The manufacturer's wind tunnel laboratory shall be available for viewing by relevant bodies upon request.
- f. Factory calibration of VAV units to be done by manufacturer before delivering. The warranty of the complete unit including the controls shall be the sole responsibility of the supplier.

Construction

- a. VAV terminal units shall be supplied in 6 nominal sizes (6.0", 10.0", 12.0", 14.0", 24.0" x 16.0"). VAV manufacturer shall have the flexibility to supply customizable inlet and outlet spigot sizes with relevant factory performance test.
- b. Multi-outlet arrangements of A-Z shall be available upon customer request. The unit shall have proper opening with collar to enable connection of flexible ducts. Manual-throttling damper for airflow balancing to be provided for each outlet spigot upon customer request. Stainless steel construction shall be available upon customer request.
- c. VAV casing shall be air-tight construction made of galvanized steel not less than 24 gauge (0.6mm) with internal insulation of at least 25mm thickness.
- d. Damper blades shall be of no less than 1.6mm thickness (double skin), with peripheral tear resistant Neoprene lip seal to ensure minimum leakage at a closed position. Damper shaft shall have damper position indicator to indicate the blade's current position. All control components shall be mounted inside a protective metal shroud attached to the VAV unit.
- e. Damper blades shall be able to travel continuously from range of 0 to 60 Deg as to provide more linear flow characteristic and hence more precise modulation of air flow.
- f. Access door shall be provided upon customer request. Access door shall be insulation to ensure minimum air leakage during operation.
- g. Airflow sensors shall be constructed of a special profile capable of significantly amplifying the velocity signal to improve reading accuracy even at low air velocity. Averaging chamber shall be provided for accurate flow measurement.
- h. Airflow sensors of nominal VAV sizes (excluding 6.0") shall have a minimum of 30 (2x15) test points and the position of the test points shall be arranged to ensure a true average measurement signal. Factory performance test shall be submitted to verify the airflow sensor accuracy.

DDC Controller

- a. The DDC controller shall be fully functional and shall be of the type that operates on open system concept (such as Lonworks for ready interfacing and freely integrating with the building's Lon based Building Automation System BAS), without any. The controller shall be capable of stand-alone and networking operation.
- b. The integral damper actuator shall be minimum 5Nm torque, over the shaft mounting type. Stroke shall be fully adjustable from 0-94 Deg rotation with visible position indicator.
- c. Integral transforms shall be provided for each VAV units to provide power supply for the controller.

Performance

- a. The static pressure drop across the VAV terminal units at maximum catalogue airflow shall not exceed 70 Pa. the throttling range shall be from 100-10%
- b. Airflow sensors shall be capable of amplifying the velocity signal by at least 2.0 times to improve reading accuracy at low air velocity.
- c. Air leakage through the damper shall be within 2% tolerance at an inlet static pressure of 750 Pa of nominal air flow.
- d. Independent of inlet pressure variations, VAV units shall modulate the delivered air volume between the specified maximum and minimum air volume with accuracy of the flow performance within +/-5% tolerance even with irregular duct approach.
- e. The noise level in the air-conditioned areas shall not exceed that as specified.
