# DUCTILE IRON AND ITS ADVANTAGES

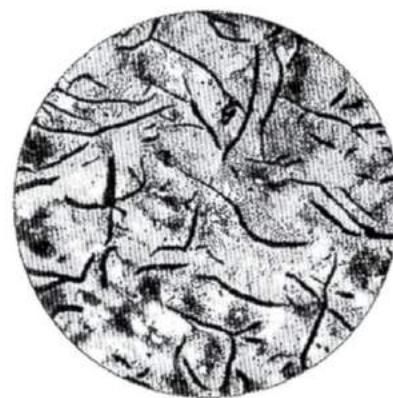

## GRAY CAST IRON VS DUCTILE IRON

Ductile iron, also known as spheroidal iron and nodular iron, is characterized by the presence of spheroidal graphite in the resultant castings. It is a modern material superior to gray cast iron, the type of iron which has been extensively used for centuries. The 'ductility' of this new iron is achieved through the unique carbon configuration which is present in the form of spheroidal or nodular graphite. In gray cast iron, also known as flake graphite iron, carbon appears in the form of graphite flakes, which causes the metal to be brittle.

**Ductile Iron**

Graphite shows as isolated spheroids in a continuous matrix

**Gray Cast Iron**

Graphite shows as a semi-continuous network of flakes

The spheroid has the capacity to absorb stress and pressure under severe shock, also allowing plastic deformation; the flake has two obvious weak points where stress concentration occurs, it becomes to fracture.

In addition, as the chemical composition of ductile cast iron is almost the same as that of gray cast iron i.e. high concentrations of carbon and silicon, ductile cast iron possesses both the anti-corrosiveness of cast iron and also a strength similar to steel.

## PROPERTIES & ADVANTAGES OF DUCTILE IRON PIPE

- High tensile strength
- High yield strength
- High impact resistance
- High elongation (ductility)
- High fatigue resistance
- Resistance to handling / transportation damage
- Resistance to second cover damage
- Simple to join having agreed joint deflection
- Resists longitudinal joint withdrawal
- Proven and cost effective internal and external corrosion protection
- Impermeable to gas and organic contaminant
- Imported back-fill not normally required
- Full range of ductile iron fittings available
- Easy pipe location when buried
- Low skill level for jointing
- Under pressure connections are not complicated
- Resistant to stray current effect due to electrical discontinuity at joints.

## Mechanical Properties

Type of Casting	Tensile Strength	Elongation		Hardness	Hydrostatic Test Pressure at Works			
		DN80 -1000	DN1100 -1200		DN80 - 300	DN350 - 600	DN700 - 1000	DN1100 - 1200
Pipes centrifugally casted	420 MPa min	10% min	7% min	230 HB max	50 bar	40 bar	32 bar	25 bar
Pipes not centrifugally casted		5% min	5% min	250 HB max	25 bar	16 bar	10 bar	10 bar
Fittings								

## Coating and Lining

Coating	Pipes and Fittings

## MANUFACTURING PROCESS

## Thickness for Pipes and Fittings

The thickness of pipes and fittings has been calculated as a function of the nominal size DN by using the formula:

$$e = K(0.5 + 0.001DN)$$

with the following values for K.

K=9 for pipes, thus

$$e = 4.5 + 0.009DN$$

K=14 for tees, thus

$$e = 7 + 0.014DN$$

K=12 for other fittings, thus

$$e = 6 + 0.012DN$$

The thickness of the pipes has been limited to 6mm and fitting to 7mm.

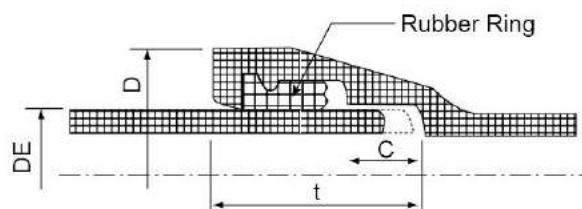

Dimensions in millimeters (mm)

NOMINAL DIAMETER DN	WALL THICKNESS		
	K=9	K=12	K=14
80	6.0	7.0	8.1
100	6.1	7.2	8.4
150	6.3	7.8	9.1
200	6.4	8.4	9.8
250	6.8	9.0	10.5

## Preparation for Joint

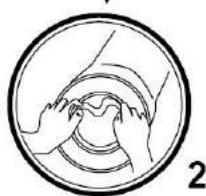

- 1) • Thoroughly clean spigot and interior of socket of joint. Apply a thin film of lubricant to gasket bulb seating area inside socket.

- Clean gasket and insert into socket with the square section gasket heel in the retaining groove and the gasket bulb towards the back of the socket.

1

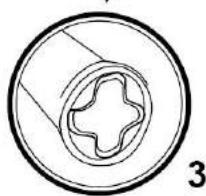

- 2) • The insertion of gasket DN80-DN700 is facilitated by folding the gasket as shown by looping into a heart shape with the gasket bulb towards the back of the socket.

2

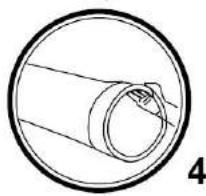

- 3) • For DN800-DN1200 it is preferable to loop the gasket into the shape of cross for insertion.

- Apply radial pressure to the gasket at the heart-shaped loops (or cross loops) to force it into place.

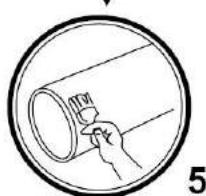

3

- 4-5) • Apply a thin film of lubricant to inside surface of the gasket and to outside surface of spigot for a distance of about 50mm for pipe sizes up to and including DN600 and 120mm for pipe sizes DN700 and above.

4

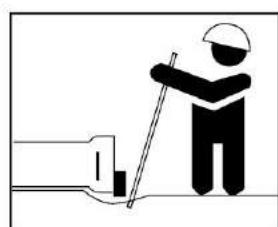

5

## Joint Assembly

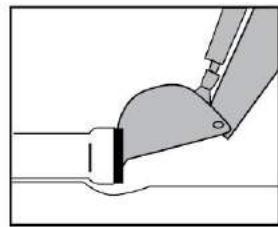

### a) Crowbar - DN80 & DN100

- Prepare and lubricate the joint area and place pipe in position ready for jointing.
- Push against the end of the pipe socket face with a crowbar or lever to complete the joint.

### b) Assembly Using Digger Bucket - DN80 & DN1200

- This method minimises the time required to make a joint and is widely used.
- Prepare and lubricate the joint area and place pipe in position ready for jointing.
- Place a wooden batten between the pipe and digger bucket.
- Push slowly and steadily until the joint is made to the correct insertion depth.

## Pipe Cutting

Ductile iron pipes can be cut by a number of methods.

Where flexible joints are to be made, the cut ends must be trimmed with a file or grinder to remove the burr formed during cutting and a chamfer must be provided.

- **A Power Driven Abrasive Disc** is one of the most widely used method for cutting ductile iron pipe. It has the advantage of being suitable for all sizes. There is no need for adjustment to suit pipe or attach machinery to the pipe. The abrasive disc are fitted to suitable hand held power tools usually driven by compressed air or small internal combustion engines.

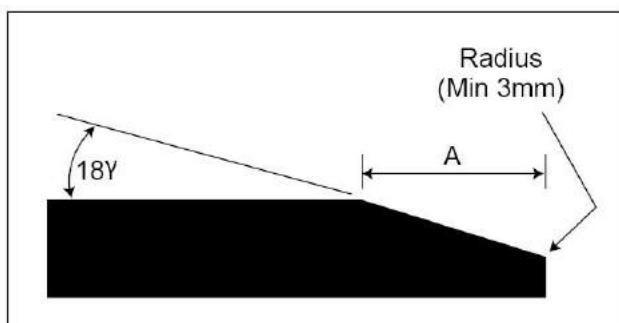

- It is important when ordering abrasive disc cutting equipment to state that it is for use with ductile iron pipe and to ensure that the disc type and size and the spindle speed of the equipment are compatible.

- **Semi-Rotary Wheel Type Cutters** are available, ranging from the standard chain link cutters to more sophisticated tools employing a rigid hinged frame. With this type of equipment it is important to ensure that wheels specifically designed for use with ductile iron are employed. This type of cutter is normally used on pipes the smaller diameters.

- **Rotary and Orbital Pipe Cutters**, using cutting tools of the simple lathe to milling saw type respectively, are available throughout the diameter range. Whichever type of cutter is employed the machine is attached to the pipe and the cutting tool is driven around the pipe by means of gears on a chain link track. The orbital type cutters have the advantages on the larger size of ductile iron pipe in that they are capable of accommodating the ovalities which are sometimes present. Some are also capable of forming the chamfer in the same operation. These type of machine are usually driven mechanically, e.g. by compressed air motor-although for pipes in the smaller diameters a hand-operated windlass may be employed. In machines using lathe type cutting tools. The cutter heads must have 7° front rake.

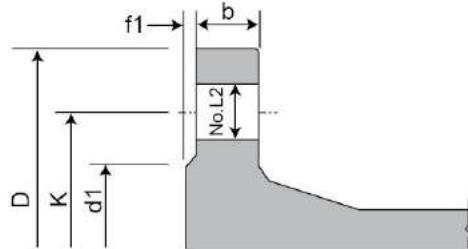

- **Reciprocating Power Saws** may also be used for cutting ductile iron pipe. These tools are usually electrically driven and for this reason they are principally used in depots or workshops where a power supply is available.

Ensure the spigot is properly chamfered. If it is a cut pipe it is essential to remake the chamfer and ensure that there is a radius to prevent the spigot from displacing the gasket.

## Bolt Tightening Sequence

- Use only 3mm thick, one piece, 80 hardness synthetic rubber gasket and to suit flange rating.
- Hold gasket in correct position on clean flange face until flanges meet.
- Use only undamaged rust free bolts, nuts and washers.
- Lubricate bolt threads and all mating surface of nuts, washers and flanges using an automotive grade of oil or grease.
- Tighten the bolts in the sequence shown until full torque is achieved.
- Check and, if necessary, re-tighten bolts immediately before pressure testing.

For sizes having 12 or more bolts, it is recommended that two jointers work simultaneously on diametrically opposed bolts tightening first nut in first quadrant then first nut in second quadrant returning to second nut in first quadrant and so on.

It is important that sufficient number of circuits are carried out to achieve the specified torque on every bolt.

## Universal Coupling

Universal Coupling Dimension

Pipe Nominal Bore (mm)	Pipe / OD		Coupling Size			Bolts	
	Min. (mm)	Max. (mm)	A	B	C	Size	No.
80	88.9	99	70	133	203	M16x150	4
100	114	126	70	133	229	M16x150	4
150	168	179	70	133	279	M16x150	4
200	219	234	83	152	356	M16x180	4
250	273	286	83	152	415	M16x180	6
300	324	334	83	152	480	M16x180	6

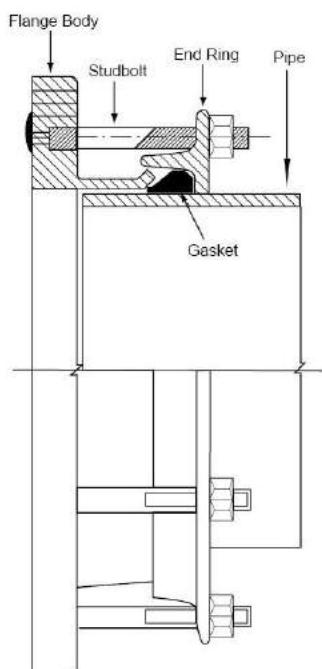

Suitable for various outside diameter pipes within permissible range.

## Universal Flange Adaptor

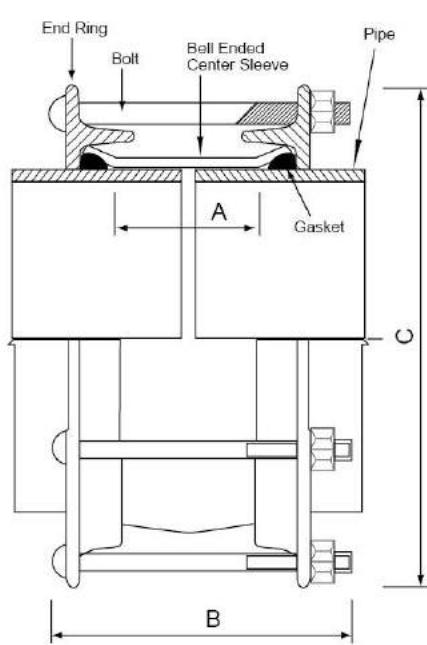

Universal Flange Adaptor Dimension

Pipe Nominal Bore (mm)	Pipe / OD		Flange Hole Details		Mainning Flange Connection Pipe / OD will Connect to Flange BS 4504 (1969)
	Min. (mm)	Max. (mm)	No.	Size (mm)	
80	88.9	99	8	19	80mm (PN10, PN16)
100	114	126	8	19	100mm (PN10, PN16)
150	168	179	8	19	150mm (PN10, PN16)
200	219	234	16	22	200mm (PN10, PN16)
250	273	286	12	26	250mm (PN10, PN16)
300	324	334	12	26	300mm (PN10, PN16)

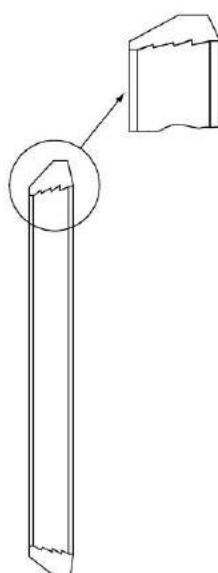

Suitable for various diameter pipes within permissible range.
