VOL : 17

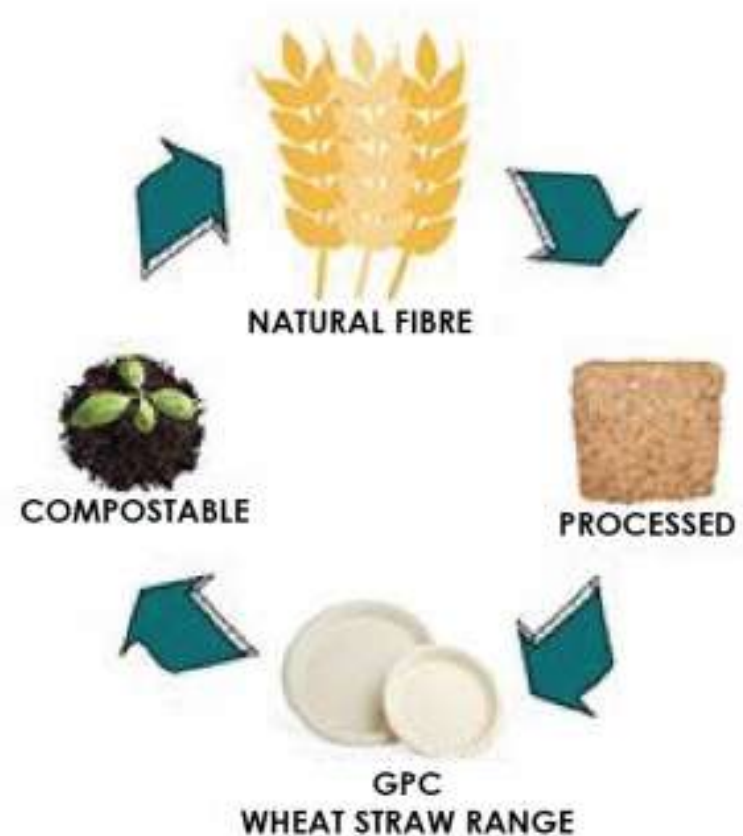

## What is Wheat straw

Wheat Straw is a free, renewable resource made of the crushed Fibers and Stalks of wheat that remains after being harvested for other agricultural uses. Wheat Straw is 100% renewable; it's leftover canes from wheat grains that are harvested and is usually treated as waste. The usual removal process of burning the wheat straw wasted contributes to pollution, while also creating a public health safety hazard. Wheat is fast growing, making it a readily available, renewable material. Demand of Wheat Straw from the farmers, generating better economic growth for their community.

### Benefits of Wheat Straw Food Service Products

- Sturdy and strong
- Microwave and freezer safe
- Handle hot liquids up to 120 Celsius
- Harmless to human body
- Environmental friendly
- biodegradable

## WHAT DOES 'BIODEGRADABLE' MEAN?

Biodegradable means an item that has the ability to break down rapidly by the actions of microorganisms, or decompose, back into natural materials in the natural environment without causing harm. For example, when a substance biodegrades into carbon dioxide, water and other naturally occurring minerals, the substance seamlessly mixes back into the earth, leaving no toxins behind. Many materials do break down in a more harmful manner, leaving chemicals or other harmful substances in the soil.

## WHAT DOES 'COMPOSTABLE' MEAN?

'Compostable' products are biodegradable, but with an added benefit: when they break down, they release valuable nutrients into the soil, aiding the growth of trees and plants. These products degrade within several months in an industrial composting facility and produce no toxic residues. Compostability is a desirable feature in traditionally disposable products such as plates, bowls, cups and cutlery. These products are commonly made out of PLA (Polylactic acid), bagasse (sugarcane fiber) or vegetable starch.

## WHY DO WE NEED BIODEGRADABLE AND COMPOSTABLE PRODUCTS?

There are lots of serious environmental and health concern associated with polystyrene and the danger associated with Styrene (which is also called Styroform), the basic building block of polystyrene. Styrene is used extensively in the manufacture of plastics. Consumers, environmental agencies, government are looking to find alternatives of Sterene; and ready to switch to biodegradable and compostable products due to the following reasons.

## WHAT ARE THE EFFECTS OF STYROFOAM?

Besides the dangers of producing EPS, Styrofoam lasts forever in our landfills. There are few known methods of breaking it down quickly though. And since expanded plastic foam is an end product, it cannot be recycled into different products, only reincarnated as itself. Styrofoam in landfills breaks down into small pieces and carried away by wind into the ocean and the environment. Marine animals and birds mistake these white pieces of EPS as food causing a whole chain of events that eventually affects our health and the planet. When we eat marine life that feed on toxic EPS, we are also taking in these harmful chemicals to our bodies. Over 100 cities and counties in the US have already banned the use of Styrofoam.

## WHAT ARE THE EFFECTS OF PLASTIC?

Harmful chemicals contained in plastics are present in the bloodstream and tissues of almost each one of us. Plastic is not biodegradable and lasts 400-450 years in our landfills. It only breaks down into smaller particles whereby its toxic chemicals are ingested by wildlife, which we have also consumed. In the U.S., it is confirmed that average consumer produces a half-pound of plastic waste daily. Two classified plastic-related chemicals are of critical concern for human health: bisphenol-A or BPA and phthalates, an additive used in the synthesis of plastic.

## DID YOU KNOW?

### STYROFOAM

NOT BIODEGRADABLE  
LASTS FOREVER

### PLASTIC

BIODEGRADES IN  
400-450 YEARS

### GLASS

BIODEGRADES IN  
1,000,000 YEARS

## REUSABLE

### BAMBOO

BIODEGRADES IN  
2-3 YEARS

Raw materials from bamboo,  
a fast-growing,  
100% renewable resource.  
Perfect for outdoor and indoor use.  
Great alternative to plasticware.

### RICE HUSK

BIODEGRADES IN  
2-3 YEARS

Raw materials from rice husk.  
Smooth, natural and elegant finish.  
Great alternative to clay,  
porcelain and glass.

### PLANET

BIODEGRADES IN  
1-3 YEARS

Raw materials from rice husk.  
Smooth, natural and elegant finish.  
Great alternative to clay,  
porcelain and glass.

## DISPOSABLE

### WHEAT

BIODEGRADES IN  
30-90 DAYS

Raw materials from wheat,  
100% renewable resource.  
Durable, lightweight and leak proof.  
It's a great alternative to  
paper and styrofoam.

### PALM LEAF

BIODEGRADES IN  
90-180 DAYS

Raw materials from naturally-fallen  
Areca-nut leaves that are washed,  
heated, pressed and sterilized.  
The perfect all-natural compliment to  
any event.

### CORNSTARCH

BIODEGRADES IN  
180-360 DAYS

Raw materials from corn starch.  
Smooth matte finish.  
Durable and leak proof, this material is  
the ideal replacement for plasticware.

## WHEAT STRAW LUNCH BOX NEW GP-W009

size : 16.5cm(H) x 14cm(D)  
material : wheat straw  
colour : brown/green  
packing : individual opp bag + brown paper box  
weight : 600g

green

pink

blue

- made of food grade wheat straw and PP material, durable, safe and healthy to use.
- suitable temperature: -20°C ~ 120°C  
Can be placed in the microwave  
Please don't use open fire to reheat directly.
