

Internal Silicone Heater used in CET Transmitters

The following CET transmitters may be ordered with an internal silicone heater for cold environment applications:

- ESH-A Remote Sensor
- LPT-M Modbus Transmitter
- CGAS-A Detector
- CGAS-D Detector

The heater is fixed to the inside of the enclosure on the base and requires an installer supplied, external 24V power source to operate. The two blue wires have no polarity and can be connected to either terminal of a 24VAC or 24VDC power source. The heater has a switch and will turn on and off appropriately to maintain operating temperature inside the enclosure.

The heater requires 10W of power.
